Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CATALYTIC ACTIVITY: Cleaves aggrecan at the 1838-Glu-|-Ala-1839 site and versican at the 1428-Glu-|-Ala-1429 site.

1. COPACTOR: Binds 1 zinc ion per subunit (By similarity).

1. SUBCELLULAR LOCATION: Secreted. Associated with the extracellular matrix (By similarity).

2. ALTERNATIVE PRODUCTS:

B. FOALL-Alternative pplicing; Named isoforms=3;

Name=1; Synonyms=ADAMTS-9B;

Isold=Q9P2N4-3; Sequence=Displayed;

Name=2; Synonyms=LADAMTS-9B;

Isold=Q9P2N4-1; Sequence=USP 007548, USP 007549;

Note=May result from the retention of an intron in the cDNA note=May result from the retention of an intron in the CDNA note=May result from the retention.

C leading to a prematurate stop codon;

Name=3; Synonyms=Short;

C leading to a prematurate stop codon;

C leading to a prematurate stop codon;

C RENTESSE SPECIFICITY: Highly expressed in all fetal tissues.

C PATESUE SPECIFICITY: Highly expressed in all fetal tissues.

C PATESUE SPECIFICITY: Highly expressed in all fetal tissues.

MEDLINE-9872426; PubMed-9409768; DOI=10.1016/S0378-1119(97)00424-1; Bertani L.E., Huang J.S., Weir B.A., Kirschvink J.L.; "Evidence for two types of subunits in the bacterioferritin of Magnetospirillum magnetotacticum.";

Gene 201:31-36(1997).
-1- FUNCTION: May perform analogous functions in iron detoxification and storage to that of animal ferritins (By similarity).
-1- COFACTOR: Binds 1 heme b (iron-protoporphyrin IX) group per

monomer (Potential).
--- SUBUNIT: Oligomer of 24 identical subunits (By similarity).
--- MISCELLANBOUS: The di-iron binding site functions as active site where iron ions are oxidized from iron(II) to iron(III) before they are stored (By similarity).
--- SIMILARITY: Belongs to the bacterioferritin family.
--- SIMILARITY: Contains 1 ferritin-like diiron domain.

Novel human anti-Factor IX/IXa antibodies against IX/IXa gamma-carboxyglutamic acid domains useful as anti-coagulant in thrombosis, stroke, and post myocardial infarction.

Claim 8; Fig 2; 84pp; English.

This sequence represents a complementarity determining region 3 (CDR3) of the light chain variable domain of a human anti-factor IX/IXa Gla domain anti-body. Factor IXa is a vitamin K dependent plasma serime procease that participates in the blood coaqulation pathways. The Gla domain of factor IXa and its zymogen factor IX contains important structural determinants for interaction with high affinity binding sites on vascular endothelial

AAT04634 encodes AAR80087 human derived light chain RT3 phage antibody. The DNA was used in the prepn. of catalytic antibody (CA) producing bacteriophage. The CAs can be used to activate/deactivate a biological function in an animal by enhancing the rate of cleavage, or formation of a specific bond within a mol. in vivo

```

```
The invention relates to methods for producing catalytic antibodies displayed on a phage. The method comprises: (a) generating a gene library of antibody-derived domains; (b) inserting coding for the domains into a phage expression vector; and (c) isolating the catalytic antibodies. The phage expression vector incorporates a histidine peptide in tandem with a myc peptide. The catalytic antibodies can be isolated by preparing an antigen; optionally immunising an animal with the antigen; generating a library of VH and VL domains from the immunised animal; cloning the VH and VL domains from the immunised animal; cloning the VH and VL domains into a phage expression vector to generate phage display
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           production of catalytic antibodies displayed on bacteriophages - comprises generating a gene library of antibody-derived domains inserting coding into a phage expression vector and isolating the catalytic antibodies.

antibodies; selecting phage display antibodies which bind specifically to the antigen; screening the selected phage display antibodies for catalytic activity to substrate; and isolating the catalytic antibodies, where the phage expression vector incorporates a histidine peptide in tandem with a myc peptide. The processes are used to produce catalytic antibodies, which can be used for in vivo activation of a prodrug. Sequences AAW95484-489 represent genetic sequences of heavy and light chains of RT3 specific phage antibodies selected from a naive human phage

Panel of specific binding members of antibody molecules which bind to whole adipocytes is used in the treatment of obesity and obesity related AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid Claim 1; Page 120; 182pp; English diseases

records of anti-adipocyte monoclonal antibody heavy chain, light chain, and heavy chain complementarity determining regions (CDR) of the and heavy chain complementarity determining regions (CDR) of the invention. The antibodies can be used in the treatment of beastry and obesity related diseases. The antibodies can be used to deliver drugs or pro-drugs directly to the fat mass of an obese patient or the antibody of an used as therspeutic itself. Antibodies binding specifically to adipocytes can be used to activate the immune system to destroy the cells by complement mediated lysis. The antibodies may be labeled with a cetectable label such as radioclabel, fluorescent or chemical group and used in methods of diagnosis in human subjects e.g. to determine the presence of adipocyte antigen on the surface of an adipocyte to detect or determine the presence or level of adipocytes in a cell or tissue sample. The antibodies can be used as an alternative means of treatment for obese patients other than undergoing surgery to remove excess fat. Antibodies for different types of fat deposits can also be produced e.g. intra-

AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid
sequences of anti-adipocyte monoclonal antibody heavy chain, light chain,
and heavy chain complementarity determining regions (CDR) of the
cinvention. The antibodies can be used in the treatment of obesity and
cinvention. The antibodies can be used to deliver drugs or
concluys directly to the fat mass of an obese patient or the antibody
can be used as a therapeutic itself. Antibodies binding specifically to
adipocytes can be used to activate the immune system to destroy the cells
by complement mediated lysis. The antibodies may be labeled with a
confidence of adipocyte artigles. Antibodies may be labeled with a
cused in methods of diagnosis in human subjects e.g. to determine the
presence of adipocyte antigen on the surface of an adipocyte to detect or
determine the presence or level of adipocytes in a cell or tissue sample.
The antibodies can be used as an alternative means of treatment for obese
contraction than undergoing surgery to remove excess fat. Antibodies
for different types of fat deposits can also be produced e.g. intracontraction.

Panel of specific binding members of antibody molecules which bind to whole adipocytes is used in the treatment of obesity and obesity related дівеавев.

Claim 1; Page 173; 182pp; English.

AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid
sequences of anti-adipocyte monoclonal antibody heavy chain, light chain,
and heavy chain complementarity determining regions (CDR) of the
invention. The antibodies can be used in the treatment of obesity and
closeity related diseases. The antibodies can be used to deliver drugs or
pro-drugs directly to the fat mass of an obese patient or the antibody
can be used as a therapeutic itself. Antibodies binding specifically to
be complement mediated lysis. The antibodies binding specifically to
by complement mediated lysis. The antibodies binding specifically to
by complement mediated lysis. The antibodies binding specifically to
by complement mediated lysis. The antibodies by the determine the
closed in methods of diagnosis in human subjects e.g. to determine the
presence of adipocyte antigen on the surface of an adipocyte to detect or
determine the presence or level of adipocytes in a cell or tissue sample.
The antibodies can be used as an alternative means of treatment for obese
patients other than undergoing surgery to remove excess fat. Antibodies
for different types of fat deposites can also be produced e.g. intraabdominal fat associated with heart disease

Specific binding members for human carcinoembryonic antigen - bind to the A3-B3 extracellular domain of hCEA and are substantially non-cross-reactive with human liver cells; used for diagnosing cancer. This polypeptide sequence comprises the light chain variable region (VL) of human carcinoembryonic antigen (hCEA)-specific antibodies CEA1, CEA2 and CEA3. VH (AAT72126-13) and VL (AAT7213-15) gene sequences were obtained for anti-hCEA antibodies CEA1-CEA7 (see AAM)8976-85). A claimed specific binding member (A) comprises an hCEA specific antibody antigen binding domain that has a dissociation constant for hCEA of less than 1 x 10 -8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-83 extracellular domain of hCEA and/or to cell-associated hCEA over hCEA over soluble hCEA. Preferred (A) include pairings of VH and VL sequences from CEA1-7, or their CDR sequences, as well as CEA6 VH and VL variants. (A) is used to detect cells expressing cancer, in vivo or in vitro, especially tumour cells for diagnosing cancer, e.g. adenocarcinoma of the colon, lung or breast 50. .56

AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid
sequences of anti-adipocyte monoclonal antibody heavy chain, light chain,
and heavy chain complementarity determining regions (CDR) of the
cinvention. The antibodies can be used in the treatment of obesity and
cinvention. The antibodies can be used to deliver drugs or
pro-trugs directly to the fat mass of an obese patient or the antibody
can be used as a therapeutic itself. Antibodies binding specifically to
adipocytes can be used to activate the immune system to destroy the cells
considered the mediated lysis. The antibodies may be labeled with a
detectable label such as radiolabel, fluorescent or chemical group and
cused in methods of diagnosis in human subjects e.g. to determine the
considered antigen on the surface of an adipocyte to detect or
determine the presence or level of adipocytes in a cell or tissue sample.
The antibodies can be used as an alternative means of treatment for obese
considered than undergoing surgery to remove excess fat. Antibodies
for different types of fat deposite can also be produced e.g. intra-
abdominal fat associated with heart disease

AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid
sequences of anti-adipocyte monoclonal antibody heavy chain, light chain,
and heavy chain complementarity determining regions (CDR) of the
twention. The antibodies can be used in the treatment of obesity and
consists a constant of the far mass of an obese patient or the antibody
can be used as a therapeutic itself. Antibodies binding specifically to
can be used as a therapeutic itself. Antibodies binding specifically to
can be used to activate the immune system to destroy the cells
by complement mediated lysis. The antibodies binding specifically to
catipocytes can be used to activate the immune system to destroy the cells
by complement mediated lysis. The antibodies binding specifically to
catipocytes and as radiolabel, fluorescent or chemical group and
catectable label such as radiolabel, fluorescent or chemical group and
cused in methods of diagnosis in human subjects e.g. to determine the
catectable label such as radiolabel, fluorescent or chemical group and
catectable the presence or level of adipocytes in a cell or tissue sample.

The antibodies can be used as an alternative means of traatment for obese
patients other than undergoing surgery to remove excess fat. Antibodies
con different types of fat deposits can also be produced e.g. intra-
abdominal fat associated with heart disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAU02501-AAU02635, and AAU02641-AAU02748 represent the amino acid sequences of anti-adipocyte monoclonal antibody heavy chain, light chain, and heavy chain complementarity determining regions (CDR) of the invention. The antibodies can be used in the treatment of obesity and obesity related diseases. The antibodies can be used to deliver drugs or pro-drugs directly to the fat mass of an obese patient or the antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Panel of specific binding members of antibody molecules which bind to whole adipocytes is used in the treatment of obesity and obesity related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antibody; adipocyte; heavy chain; light chain; obesity; fat; heart disease; complementarity determining region; CDR.

ö
can be used as a therapeutic itself. Antibodies binding specifically to adjocytes can be used to activate the immune system to destroy the cells by complement mediated lysis. The antibodies may be labeled with a detectable label such as radiolabel, fluorescent or chemical group and used in methods of diagnosis in human subjects e.g. to determine the presence of adjocyte antigen on the surface of an adjocyte to detect or determine the presence or level of adjocytes in a cell or tissue sample. The antibodies can be used as an alternative means of treatment for obese patients of the unundergoing surgery to remove axcess fat. Antibodies abdominal fat associated with heart disease

The invention relates to a novel antibody specifically binding neurokinin B. An antibody of the invention has hypotensive, and gynaecological activity, and may have a use in gene therapy. The antibody is useful for preparing a composition for treating or preventing hypertension or preclampsia. The present sequence is used in the exemplification of the invention. Ouery Match 100.0%; Score 58; DB 8; Length 242; Best Local Similarity 100.0%; Pred. No. 0.056; Matches 11; Conservative 0; Mismatches 0; Indel8 Sequence 242 AA;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Description

Natl. Acad. Sci. U.S.A. 99:16899-16903(2002). INTERACTION WITH PTDINS(3,4,5)P3 AND INS(1,3,4,5)P4, TISSUE SPECIFICITY, AND SUBCELLULAR LOCATION.
PubMed=14690521; 2

Hanck T., Stricker R., Sedehizade F., Reiser G., Identification of gene structure and subcellular localization of human centaurin alpha 2, and p42IP4, a family of two highly homologous, Ins 1,3,4,5-P4-/Ptdins 3,4,5-P3-binding, adapter

affinity.
SUBCELLUIAR LOCATION: Cytoplasmic. Constitutively associated with the plasma membrane. Excluded from the nucleus.
ALTERNATIVE PRODUCTS:

Event=Alternative splicing; Named isoforms=2; Name=1;

IsoId=Q9NPF8-1; Sequence=Displayed;

Isold=ONNPPB-2; Sequence=VSP_011180;
Note=May be due to a competing acceptor splice site. No
experimental confirmation available;
-1- TISSUE SPECIFICITY: Highly expressed in placenta, spleen, kidney,
skeletal muscle and adrenal gland. Weakly expressed in thyroid,
liver, heart, lung, small intestine, peripheral blood leukocytes.
Not detected in spinal cord, brain, stomach, trachea, colon, lymph
node and bone marrow.
-1- SIMILARITY: Contains 1 Arf-GAP domain.

Mature 422.859-868(2003).
LI Wature 422.859-868(2003).
LI FUNCTION: Cytoplasmic dynein acts as a motor for the intracellular retrogerade motility of vesicles and organelles along microbules.
Dynain has APase activity; the force-producing power stroke is bynein has APases activity; the force-producing power stroke is bynein has APases activity; the force-producing power stroke is bynein has APases activity; the force-producing power stroke is nuclear distribution in hyphae.

LI FUNCTION: Cytoplasmic dynains and a number of nuclear distribution in hyphae.

LI SUBUNIT: Consists of at least two heavy chains and a number of which binds cargo and lineraced with one per AAA domains in the head or motor domain. T rmal nuclear distribution in filamentous fungi."; Cell Biol. 127:139-149(1994).

SIMILARITY: Belongs to the dynein heavy chain family.
